Project Description

This project is a travel website built for people who don't just want to visit a place, but actually experience it. It gives users an easy way to learn about a destination's culture, climate, and neighborhoods while also helping them find flights and compare prices. What really makes it different is the focus on local insight: instead of pushing only the usual tourist hotspots, the site highlights places locals would recommend and experiences that feel more authentic and less overcrowded. The goal is to help travelers plan smarter trips, avoid the obvious tourist traps, and feel more connected to the places they visit.

Possible benefits of the project

- Supports local economies by directing travelers toward small businesses and lesser-known areas
- Creates more responsible travelers by educating users about local customs and expectations before they arrive,

- Appeals to both tourists and locals (locals can share or validate recommendations, keeping content relevant)
- Builds trust since recommendations feel personal rather than sponsored or generic
- Encourages repeat use because users can return to discover new places within the same destination

Estimated duration of the project

2–3 months, including planning, development, content integration, and testing.

UI/UX and User-Centric aspects of the project

The website will feature a clean, intuitive interface that makes exploring destinations, learning about culture, and finding flights easy. Users will see local-favorite recommendations highlighted alongside popular spots, with visual cues and maps for easy navigation. The platform will offer personalized browsing based on interests, use images and storytelling to connect users with destinations, and maintain an accessible design for all devices.
